

Computational Finance

StreamHPC has **consulted** at various small and big financial institutes to improve the performance of their software: From optimising databases and computations to introducing modern hardware solutions such as FPGAs and GPUs.

We worked for fintech company Tempus energy to **speed up their forecasting** software to run under a minute. This speedup was necessary for them to improve their computational model so they could better serve their customers.

We can help you in developing **high-performance** and **low-latency** solutions as determined by your requirements. Please [contact us](#) to discuss what we can do for you.
