

Smart cameras

Decentralised camera solutions help make smart solutions, which can be processed locally. Besides mobile applications, decentralised processing is less prone to fall-out, as there is only one point of failure and can be easily replaced. Smart cameras are used as:

- CCTV - detecting situations of interest, counting people
- Factory Process Monitoring - quality control
- Part sorting and identification -
- Robot guidance

Our main focus is industrial applications, for modernising the factory floor. Our full solution consists of fully redundant cameras, high-speed software, quickly installable spare parts and support.
